# **Exercise: Data Types and Variables**

Problems for exercises and homework for the "Technology Fundamentals" course @ SoftUni.

You can check your solutions in Judge.

# 1. Integer Operations

Read four integer numbers.

Add first to the second, divide (integer) the sum by the third number and multiply the result by the fourth number. Print the result.

#### **Constraints**

- First number will be in the range [-2,147,483,648... 2,147,483,647]
- Second number will be in the range [-2,147,483,648... 2,147,483,647]
- Third number will be in the range [-2,147,483,648... 2,147,483,647]
- Fourth number will be in the range [-2,147,483,648... 2,147,483,647]

### **Examples**

Input	Output	Input	Output
10	30	15	42
20		14	
3		2	
3		3	

# 2. Sum Digits

You will be given a single integer. Your task is to find the sum of its digits.

# **Examples**

Input	Output		
245678	32		
97561	28		
543	12		

## 3. Elevator

Calculate how many courses will be needed to **elevate n persons** by using an elevator with **capacity of p persons**. The input holds two lines: the **number of people n** and the **capacity p** of the elevator.

Input	Output	Comments	
17 3	6	5 courses * 3 people + 1 course * 2 persons	
4	1	All the persons fit inside in the elevator.	

5		Only one course is needed.	
10 5	2	2 courses * 5 people	

#### **Hints**

- You should **divide n by p**. This gives you the number of full courses (e.g. 17 / 3 = 5).
- If n does not divide p without a remainder, you will need one additional partially full course (e.g. 17 % 3 = 2).
- Another approach is to round up  $\mathbf{n} / \mathbf{p}$  to the nearest integer (ceiling), e.g.  $17/3 = 5.67 \rightarrow$  rounds up to 6.
- Sample code for the round-up calculation:

```
int courses =
              (int) Math.ceil((double) n /
```

#### 4. Sum of Chars

Write a program, which sums the ASCII codes of n characters.

Print the sum on the console.

#### Input

- On the first line, you will receive n the number of lines, which will follow
- On the next **n lines** you will receive letters from the **Latin** alphabet

## **Output**

Print the **total sum** in the following format:

The sum equals: {totalSum}

#### **Constraints**

- n will be in the interval [1...20].
- The characters will always be either upper or lower-case letters from the English alphabet
- You will always receive one letter per line

Input	Output			
<b>5</b> A b	The	sum	equals:	399
A b C d E				

Input			Output	
12	The	sum	equals:	1263
S				
o f				
f				
t				
U				
n i				
R				
u				
1				
z z				
z				

## 5. Print Part of the ASCII Table

Find online more information about ASCII (American Standard Code for Information Interchange) and write a program that **prints part of the ASCII table** of characters at the console.

On the first line of input you will receive the char index you should start with and on the second line - the index of the last character you should print.

# **Examples**

Input	Output
60 65	<=>?@A
69 79	EFGHIJKLMNO
97 104	a b c d e f g h
40 55	()*+,/01234567

# 6. Triples of Latin Letters

Write a program to read an integer **n** and print all **triples** of the first **n small Latin letters**, ordered alphabetically:

Input	Output
3	aaa
	aab
	aac
	aba
	abb
	abc
	aca
	acb
	acc
	baa
	bab
	bac
	bba
	bbb
	bbc
	bca
	bcb
	bcc
	caa
	cab
	cac
	cba
	cbb
	cbc
	cca
	ccb
	ccc

#### Hints

Perform 3 nested loops from 0 to n-1.

```
for (int i = 0; i < n; i++) {
    for (int j = 0; j < n; j++) {
        for (int k = 0; k < n; k++) {
        }
```

For each iteration generate new letters

```
char firstChar = (char) ('a' + i);
 /TODO Find other two characters
```

Concat all characters in a string and print it. You can use **String.format()**.

```
System.out.printf("%c%c%c%n", firstChar, secondChar, thirdChar);
```

### 7. Water Overflow

You have a water tank with capacity of 255 liters.

On the next n lines, you will receive liters of water, which you have to pour in your tank.

If the capacity is not enough, print "Insufficient capacity!" and continue reading the next line. On the last line, print the liters in the tank.

#### Input

The **input** will be on two lines:

- On the **first line**, you will receive **n** the number of **lines**, which will **follow**
- On the next n lines you receive quantities of water, which you have to pour in the tank

#### **Output**

Every time you do not have enough capacity in the tank to pour the given liters, print:

#### Insufficient capacity!

On the last line, print only the liters in the tank.

#### **Constraints**

- n will be in the interval [1...20]
- liters will be in the interval [1...1000]

Input	Output		
5	<pre>Insufficient capacity!</pre>		
20	240		
100			
100			

Input	Output
<b>1</b> 1000	<pre>Insufficient capacity! 0</pre>

<mark>100</mark>		
20		

Input		Output
7	105	
10		
20		
30		
10		
5		
10		
20		

Input	Output		
4	Insufficient	<pre>capacity!</pre>	
<mark>250</mark>	Insufficient	capacity!	
<mark>10</mark>	Insufficient	capacity!	
<mark>20</mark>	<mark>250</mark>		
<mark>40</mark>			

# 8. Beer Kegs

Write a program, which calculates the volume of **n** beer kegs.

You will receive in total 3 \* n lines. Each three lines will hold information for a single keg.

First up is the **model** of the keg, after that is the **radius** of the keg, and lastly is the **height** of the keg.

Calculate the volume using the following formula:  $\pi * r^2 * h$ .

At the end, print the **model** of the **biggest** keg.

#### Input

You will receive 3 \* n lines. Each group of lines will be on a new line:

- First model string.
- Second -radius floating-point number
- Third **height integer** number

### Output

Print the model of the biggest keg.

#### **Constraints**

- n will be in the interval [1...10]
- The radius will be a floating-point number in the interval [1...3.402823E+38]
- The height will be an integer in the interval [1...2147483647]

Input	Output		
3	Keg 2		
Keg 1			
10			
10			
Keg 2			
20			
20			
Keg 3			
10			
30			

Input	Output		
Smaller Keg 2.41 10 Bigger Keg 5.12 20	Bigger Keg		

# 9. \*Spice Must Flow

Spice is Love, Spice is Life. And most importantly, Spice must flow. It must be extracted from the scorching sands of Arrakis, under constant threat of giant sand worms. To make the work as efficient as possible, the Duke has tasked you with the creation of a management software.

Write a program that calculates the **total amount** of spice that can be extracted from a source.

The source has a starting yield, which indicates how much spice can be mined on the first day. After it has been mined for a day, the yield drops by 10, meaning on the second day it'll produce 10 less spice than on the first, on the third day 10 less than on the second, and so on (see examples).

A source is considered profitable only while its yield is at least 100 – when less than 100 spice is expected in a day, abandon the source.

The mining crew consumes 26 spice every day at the end of their shift and an additional 26 after the mine has been exhausted. Note that the workers cannot consume more spice than there is in storage.

When the operation is complete, print on the console on two separate lines how many days the mine has operated and the total amount of spice extracted.

#### Input

You will receive a **number**, representing the **starting yield** of the source.

### Output

Print on the console on two separate lines how many days the mine has operated and the total amount of spice extracted.

#### **Constraints**

The starting yield will be a positive **integer** within range [0 ... 2 147 483 647]

# **Examples**

Input	Output	Explanation
111	2	<b>Day 1</b> we extract 111 spice and at the end of the shift, the workers consume 26, leaving 85. The yield drops by 10 to 101.
		<b>Day 2</b> we extract 101 spice, the workers consume 26, leaving 75. The total is 160 and the yield has dropped to 91.
		<b>Since</b> the expected yield is less than 100, we abandon the source. The workers take another 26, leaving 134. The mine has operated 2 days.
200	11 1338	

#### \*Poke Mon **10**.

A Poke Mon is a special type of pokemon which likes to Poke others. But at the end of the day, the Poke Mon wants to keeps statistics, about how many pokes it has managed to make.

The Poke Mon pokes his target, and then proceeds to poke another target. The distance between his targets reduces his poke power.

You will be given the poke power the Poke Mon has, N – an integer.

Then you will be given the distance between the poke targets, M – an integer.

Then you will be given the exhaustionFactor Y – an integer.

Your task is to start subtracting M from N until N becomes less than M, i.e. the Poke Mon does not have enough power to reach the next target.

Every time you subtract M from N that means you've reached a target and poked it successfully. COUNT how many targets you've poked – you'll need that count.

The Poke Mon becomes gradually more exhausted. IF N becomes equal to EXACTLY 50 % of its original value, you must divide N by Y, if it is POSSIBLE. This DIVISION is between integers.

If a division is not possible, you should NOT do it. Instead, you should continue subtracting.

After dividing, you should continue subtracting from N, until it becomes less than M.

When N becomes less than M, you must take what has remained of N and the count of targets you've poked, and print them as output.

**NOTE**: When you are **calculating percentages**, you should be **PRECISE** at **maximum**.

Example: 505 is NOT EXACTLY 50 % from 1000, its 50.5 %.

#### Input

- The input consists of **3 lines**.
- On the **first line** you will receive **N** an **integer**.
- On the **second line** you will receive **M** an **integer**.
- On the **third line** you will receive **Y** an **integer**.

#### **Output**

- The output consists of **2 lines**.
- On the first line print what has remained of N, after subtracting from it.
- On the **second line** print the **count** of **targets**, you've managed to poke.

#### **Constrains**

- The integer **N** will be in the **range** [1, 2.000.000.000].
- The integer **M** will be in the range [1, 1.000.000].
- The integer Y will be in the range [0, 9].
- Allowed time / memory: 16 MB / 100ms.

#### **Examples**

Input	Output	Comments
5 2 3	1 2	<ul> <li>N = 5, M = 2, Y = 3.</li> <li>We start subtracting M from N.</li> <li>N - M = 3. 1 target poked.</li> <li>N - M = 1. 2 targets poked.</li> <li>N &lt; M.</li> <li>We print what has remained of N, which is 1.</li> <li>We print the count of targets, which is 2.</li> </ul>
10 5 2	2 1	N = 10, M = 5, Y = 2.  We start subtracting M from N.  N - M = 5. (N is still not less than M, they are equal).  N became EXACTLY 50 % of its original value.  5 is 50 % from 10. So we divide N by Y.  N / Y = 5 / 2 = 2. (INTEGER DIVISION).

#### 11. \*Snowballs

Tony and Andi love playing in the snow and having snowball fights, but they always argue which makes the best snowballs. They have decided to involve you in their fray, by making you write a program which calculates snowball data, and outputs the best snowball value.

You will receive **N** – an **integer**, the **number** of **snowballs** being made by Tony and Andi.

For each snowball you will receive 3 input lines:

- On the **first line** you will get the **snowballSnow** an **integer**.
- On the **second line** you will get the **snowballTime** an **integer**.
- On the **third line** you will get the **snowballQuality** an **integer**.

For each snowball you must calculate its snowballValue by the following formula:

(snowballSnow / snowballTime) ^ snowballQuality

At the end you must print the **highest** calculated **snowballValue**.

## Input

- On the **first input line** you will receive **N** the **number** of **snowballs**.
- On the **next N \* 3 input lines** you will be receiving **data** about **snowballs**.

## Output

- As output you must print the **highest** calculated **snowballValue**, by the formula, **specified above**.
- The output format is:

{snowballSnow} : {snowballTime} = {snowballValue} ({snowballQuality})

#### **Constraints**

- The number of snowballs (N) will be an integer in range [0, 100].
- The **snowballSnow** is an **integer** in **range** [0, 1000].
- The **snowballTime** is an **integer** in **range** [1, 500].
- The **snowballQuality** is an **integer** in **range** [0, 100].
